

Problem Statement 1

The Green-Truth Auditor: Combating Greenwashing

Theme: Responsible Consumption & Climate Action

The Challenge: "Greenwashing" creates a lack of consumer trust. Brands use vague marketing buzzwords like "eco-friendly" to hide high-carbon supply chains, making it impossible for ethical consumers to make informed choices.

The Task: Build an **Intent-Aware Sustainability Auditor**. The tool must parse product descriptions or URLs and use NLP to categorize claims as "Vague/Unverifiable" or "Fact-Based/Certified."

- **Must-Haves (MVP):**
 - **Input Interface:** A text box for product descriptions or a URL scraper.
 - **Buzzword Detection:** A logic-based flag system for terms like "natural," "green," and "eco-conscious."
 - **Categorization:** Using a pre-trained model to classify sentences as "Marketing Fluff" vs. "Evidence-Based."
- **Good-to-Haves (Winning Edge):**
 - **RAG (Retrieval-Augmented Generation):** Connecting the tool to a CSV/Database of certified B-Corps or GOTS-certified brands.
 - **Reasoning Summary:** An AI-generated explanation of *why* a specific product failed the audit.
